fpGIddev Installation

fpGIddev is our fPclient toolkit for the GUI (Graphic User Interface) commonly referred to as fileProGI. This package requires a license for complete installation.

1. If you are installing fpGIddev from a fP Technologies installation CD, go to step 3. If you have downloaded fileProGI from our website, unzip the fpGIddev download file into a temporary directory now.
2. Run Setup.exe from the Windows Start Run dialog box or by clicking on the setup.exe in the fpGIddev temporary directory or CD as applicable.
3. Carefully follow the instructions provided within the fpGIddev install shield.
4. Determine the computer name and disk drive serial number using
"~/fp/fpgiddev/getvolumeserialnumber.exe"
5. Request a license for fpGIddev by going to our website download area and click on GIserv license. Fill out the required entries on the form for Developer Toolkit license using the information provided by step 4.
6. Save the fpGIddev license file to the ~/fp/fpgiddev directory as filename "fpdevlic.dat".
7. The installation creates a fpGIddev Icon on your Desktop and/or Programs folder based on the install options you have selected. Click on the applicable icon to start the Development Toolkit for fileProGI. Note that GIserv must be started before running fpGIddev.

Note: When upgrading, depending on the last version of filePro that has been installed, you may have to override the path locations for ~/fp and ~/filePro directories on your system. Make sure to include the correct location of these directories during the install to properly set your program and data directories paths and to properly create the configuration files for fpGIddev.
